

**Acc# 133780**

Testudine – Eastern Box Turtle, Female

**History:**

Female EBT found with head trauma, placed feeding tube 5/10 and need position check.

**Assessment:**

1. Feeding tube placement, likely distal to the gastric lumen
2. Skull fracture - parietal or pterygoid bone

**Report:**

Plastic tubing is superimposed on the left side of the coelomic cavity and terminates at the level of the distal 1/3 of the coelom. The exact location of the tubing cannot be identified, but likely terminates beyond the gastric lumen given its caudal location. There is an oblique, minimally displaced skull fracture, likely of the parietal or pterygoid bone.
